### **MacDermid Printing Solutions Introduces Next Generation Corrugated Photopolymer Plate**

**Atlanta, Georgia – February 1, 2008:** MacDermid Printing Solutions announced today the introduction of **MGC**, its next generation sheet photopolymer specifically designed to compete in the corrugated print market. This innovative new product provides customers with superior imaging capabilities and shorter processing times. Printers can take advantage of **MGC**'s ability to image fine details in a 250 mil (6.35mm) plate without the need to back mask, achieving a level of detail that was previously unattainable. Combined with faster processing times that provide 15-20 minute cycle time savings, **MGC** offers advantages to both the plate maker and printer. This is the first of eight new products that MacDermid will be introducing in 2008.

**MGC** is commercially available in thicknesses from 0.112 in (2.84mm) to 0.250 in (6.35mm), and in format sizes up to 52 x 80 inches (1,321 x 2,032 mm). For additional information, customers can contact MacDermid Printing Solutions at 800-348-7201 or [www.macdermid.com/printing](http://www.macdermid.com/printing).

MacDermid Printing Solutions is a worldwide leader in the manufacture and marketing of a variety of products used in the printing of packaging, publications, and other commercial applications using flexographic, offset and letterpress printing. The company offers a full range of products including photopolymer plates, platemaking systems and blankets for offset coating and printing.
